Venture Capital Presentation to Amazon-Ventures Summit for Chinese-Industry Partnership Investments Group

Presented Mathematical Concepts and Product/Market Industry path to ASI (Artificial Super Intelligence) via Capital Markets, Economics and General Finance via Artificially Synthesized Economies via Gauge Theory for the purposes of Agentiq AI Coordination. The unique and valuable aspect of this theory is that it enables Hyper-Scaler systems to scale and under fully coordinated execution into the 1B+ population count of simultaneously operating and coordinated Agent Systems.

The request to present was originally to just educate the Chinese Executives on Agentic AI, how it works and then I decided to throw in the idea of Gauge Economics which I had been working on to publish into the research record with a coordinated group from Amazon Ventures (Pheobe Wang), Ben (Jepson) Taylor in Utah (VEOX), and Sam Zaruber at UW. At a lunchtime review meeting it was suggested that I add a pitch for Agentiq Capital (my startup) which was not originally communicated, just that this was an educational meeting. Additionally, I was told that the content would be professionally translated after the meeting and sent to the full panel where they would have a chance to view it. I was told that the panel consisted of 40 executives from Chinese Publicly traded companies.

04/08/2025 – 05/05/2025

“Two Free Employees”

Johnson Zhu

After the presentation, I was told that one executive loved the presentation and the business concept and would love it if we would consider hosting his son for his Summer Internship. This was Johnson Zhu which I agreed to and he began working for Agentiq Capital on May 5th, 2025. Johnson was a genuine and hard working employee. So sincere and appreciated that, when his work was over and time finished, he paid on his own to stay I believe 10 days in Seattle to meet myself and the Amazon contacts to say thank you and take us to dinner. I spent several days with him taking him around Seattle. He is still technically “with” the company and has made available the opportunity to work with Duke Universities Financial Machine Learning Group. We have not had time to pursue this second phase of our organizational plan however, even with the delays to deliver the documents in proposals and presentation content that he needs to make official the partnership with the prof and PhD Candidates he remains open and eager when we meet.

Wilson Shang

Wilson was a bit of a different story. About 5-12 days after the presentation, our sourcing contact at Amazon, (sends us candidates willing to work for equity-only or low wage deals) said someone, a semi-relative (Note-1), currently in China wants to move to the US and was looking for a job. She gave me his contact and we exchanged information. Wilson (WS) contacted me mentioning that he needed a formal letter of some kind because he was worried about getting through immigration/customs upon landing in the US. I obliged and sent him something like an offer letter. Essentially serving as a pitch/interview, I took Wilson to Anthony's in Kirkland on (INSERT-DATE). I communicated the Corporate Concept and Market Opportunities. He asked questions but, was mostly silent. At the end of the dinner he mentioned as we were parting that he has an interview at Amazon, which was really the reason that he came here and was excited about that but, if he met anyone who might be interested, he would let them know. A letter to get through Immigration, a \$300 dinner – it felt very using and purely interested to get a note and a nice dinner. I almost deleted and blocked his contact info at this moment. In hind-sight, I have realized that, interview candidates at Amazon, coming from overseas that request to interview in person, have their US Customs paperwork completely handled and do not need to contact resource starved startups to pass through immigration. About 10 days later he contacted me, semi-jokingly saying that he wouldn't be joining amazon after all and that if the job was still available. I said yes but I couldn't pay him, especially after that sequence of interactions. He responded that that is fine, he will consider it a resume-building project.

Note-1: a friends husbands brother in-law or something like that

Along the way, he was extremely difficult, not personally but, in terms of executing the work toward packaged-product finalization. He frequently would say things like “I don't get any input” when I specified features and “My ideas cant be tried” when I would ask him to delete features that were never requested and were degrading to the functionality or presentation. Along the way he would always delete text and verbiage referencing “ASI”, “Artificial Super Intelligence”, or “Super Intelligence” and always replace it with “FinTech” which I always responded to never use as it has generally been considered non-valuable from a Venture or Tech-Industry Business-Valuation perspective for some time.

However, the more obvious actions that revealed something different in his intentions for residing at Agentiq Capital happened primarily in December. In reviewing production and personnel performance which I do time to time, I noticed that between late November and mid-December, Wilson's productivity was what I had been looking for, wanting, and expecting. Seemingly sustained and that he was delivering and arguing less, I offered him, first an additional 250,000 (Attch #001) shares (2.5% equity position). Some days later, I thought, its critical, motivate him 1000%: I gave him a verbal options contract for 10% of the Companys shares on successful delivery of our MVP business objectives. Especially as I knew once we are in Go-To-Market, we would have operational issues as well as needing to respond to customers problems as well as feature-requests. This produced a very clear and quite unexpected response. He suddenly became more and more erratic in mental as well as physical behavior and his need to be listened to and be in personal conversation instead of work went up significantly with the subject matter primarily around Communist Principals, Mao Zhe Dong, and being a “Humanist”. Other things like, not drinking diet coke because its making him mad and things like, checking how people leave their tires turned when they park is something he looks for.

But, his actions relative to our codebase and my communications of upcoming venture-partner events and reviews by financial professionals of our site was much more telling. Shortly after I communicated to him that I was getting ready to have the site reviewed and go in to venture pitch he updated our about page which was

never requested and never mentioned that this was done. On the days of our meeting to discuss the about page I gave Business or Corporate-Theory Centered reasons for our choices and why certain statements are absolute and why things must be a certain way (Attch #002). Of these they were:

- for Team photos, they should be the same in terms of one team member to another. And the corporate principle of the Redefinable Corporate Face and that focused or heightened CEO attention violates this generally but, especially if a CEO receives public notoriety with the Tech industry being the exception with continued violation of this principle.
- Our About page, should be and needs to be the only page where we focus, establish, and communicate our ASI focus as this is our primary and fundamental purpose and principle as a company and what we are organized for, even though we are initially product focused toward the first time retail market.

I had not noticed this change as generally, I was not expecting agreed upon and accepted to be finished and complete artifacts or work units to be randomly updated at some future point in time. But, upon the initial review of some business contacts that are personal friends who asked me what am I even thinking with the things that I have on the site. I began a review starting with the about page of what they were talking about. This was the absolute wake up moment for me that, Wilson Shang was absolutely present with us for the purpose of some kind of subversion. The page had been updated to be extremely salesy, mentioning only our commitment to FinTech. Additionally my picture had been made to take up the width of the page in a giant overwhelming presence – clearly trying to show a company of minimal value with a self-centered CEO motivated for self-importance and, absolutely in 180 degrees opposition and fully contrary to everything that I had said were the guiding first-principles that we must follow in our meetings. Upon noticing this I had a meeting with Wilson and mentioned that this must be reversed, that I want the exact commit ID rolled back to, and that if this ever happens again, we would need to review his performance. He did a redesigned page that went back to a similar version but, intended to produce a violation of my demands.

I told Wilson that I had a Venture Pitch that would like his help with to do the pitch as a web-page instead of a slide deck and that would be a chance to make it look better as well as a way for our audience to have a chance to review the pitch deck on an indefinite time basis. He agreed and did an exceedingly good job. Turning it around quickly and without argument. I thought that my firm reprimand had produced exactly the effect that I had desired and that he was back and more committed than before. Because of this I invited him to the pitch and to co-present or at least to receive credit for the pitch deck and for investors to have the chance to meet him and ask him questions if they wanted to. He declined and said that he doesn't like meeting people and that he wants to keep to himself.

A few days after the 2/3/2026 pitch, Shaohua Lu (the new hire) and myself identified that the Site generally but especially the Application looked incredibly terrible. The texts had been made to take up excessive horizontal width and all Component-Container Boxes had been shrunk, producing overflow on every single feature or artifact on our Primary Application. This was the absolute moment: Wilson's intention was secret subversion at business-critical moments, intending to produce a reputation amongst business contacts and professional investors of our incompetence. He was terminated on 2/16/2026 (CritDate #TBD).

Summary:

I believe that Wilson Shang was sent by either the Chinese Military or Chinese Intelligence for the purposes of subversion of Agentiq Capital and our agenda as part of a concerted, coordinated, and vastly expansive effort by the Chinese government to at least impede but more ideally cause the absolute and total failure of the American Artificial Super Intelligence agenda, allowing China to claim to have invented or achieved it and reside as the source of its success and not America.

This must be stopped: Not just about the “glory” of ASI, if allowed even to be minimally operating, they will use the outcomes of programs like this to communicate globally that investments in tech fail in the US more often than not and succeed within the borders of the Chinese Nation and that therefore, you are only a good, smart and successful investor if you are allowed to invest there.

02/17/2026 – Now

“Cover Girl Girlfriend and Cyber Crimes”

I met Amy Li (Xiang Li) on 03/17/2026 at Paddy Coyne’s Irish Pub in Bellevue Washington at 12:00 PM for our “first date”. On our third date, in her apartment, I saw her dating pictures in her phone which we looked at together. I noticed the date on them, that they had iMessage links, and a location (her phone since I met her was in lock down mode with no iMessage, no Location Services, etc. – in its most minimal and restricted operating mode). They were sent to her on 2/17/2026 by a friend (Amber or Amanda, I forget this person’s name) while on vacation in Las Vegas. This photo is a screen shot that I took of the location where the Burning-Woman was taken – also on 2/17/2026 and the likely location of where this meeting took place or shortly before or after.

I thought it strange that her dating photos, clearly taken years earlier, were “owned” by a friend and needed to be sent by a friend. In addition, I thought it strange that she used to have location on but, since we have met, she does not.

Next to these photos was a sexual picture of a woman’s body outlined in fire and a photo of her looking out in a direction toward the horizon with a highly held and focused “V” symbol. The stranger part was that this was exactly after I had fired Wilson. Rather than responding or making a comment, I made the decision to maintain a quiet but sustained awareness of this possibility. That she might be a directed asset or agent as “girlfriend” for the purposes of producing personal costs (which Wilson always worked to do) and attempting to waste a maximum of time my time. I felt relatively certain that she would not produce physical threats as Wilson, other than toward the end had been primarily peaceful and not producing any kinds of obvious or physically threatening behaviors. (See below – Money Laundering Crimes or - Payment for a services upgrade: Girlfriend converted to Hitman).

Cyber Crime Event – Subverting an upgraded and significantly more productive new Software Development setup:

On the night of #TBD, I invited Amy over to code with me. The coding in the new environment was fun and without the traditional impediments – so much so that I thought it might be available for a Date Night. So I invited her over with the idea that, rather than me working through the night and into the morning alone and leaving her by herself at her apartment for the night and forgetting her, we could code together and she would have fun. She said that she doesn't want to do that once she got there but would like to watch. Later on in the night – between 10 PM – 2 AM she said “oh, password reset what?” surprised and outload while she was in my bed while I was coding. She then asked “Brian, can I connect to your Wi-Fi”. I found the Wi-Fi router password on my phone and brought it up and went over to help her put it in. Later on that in the early morning, the IDE lost its connection to the Generative AI Model systems. Then after that, the buttons went missing. I thought all of this suspicious so, I wanted to review the network logs. My roommate (Matt Ebert) is an IT Administrator and Security Specialist. So, while assuming and hoping for the best in her, that she was mostly an innocent asset without active subversion, I would look into it. Matt has enterprise controls established. He informed me that no new client device in any way connected to any WiFi Access Point or Router in the House and that he gets immediate notifications on his phone when they do connect. It was now obvious. She connected her phone, it established itself to my computer as the WiFi access point and from there, began attacking my ability to use an obvious and extremely productive coding platform. The attack surgically hit the Gemini AI Ultra Plan's AntiGravity IDE by resetting the local IDE settings and configuration to negate the connections to the generative coding agents and model systems. Initially, I thought her to be innocent or at least, not actively triggering the subversion herself. That is she was contacted, that perhaps through WeChat, someone else accessed my network. However, I had just reset all of my passwords so, the “Password Reset” comment from her and then an immediate request to login to my WiFi while when I observed her phone connected and helped her enter the password, it never actually connected however, she said thank you in acknowledgement that the phone had connected, that she in fact deliberately perpetrated at least some kind of connection incident to enable this to happen and that it was at her direction as she was watching me code and seeing how fast things were occurring and being developed for our “Vibe Trading” Platform and wanted to subvert what I was doing.

Personal Money Laundering, Tax Evasion, or more sinister: An Upgrade to Hitman Status

I stay at Amy's Condo on the 33rd floor in the Bellevue Towers (Apt #3302) most nights. Every morning when we wake up, generally between 7 and 7:30, she checks her phone. After roughly ten days of knowing her, there were people requesting to send her money. These random payments are usually \$4,000 - \$5,000 a couple times a week that I see. However, recently, they have been coming multiple times throughout the morning and through the night and, the people sending her money are asking her what is her phone number to send it to, indicating that this is the first time they have sent her money. These payments are always multiple thousands of dollars and they have been happening now at a lightning rate. They always then go into a Bank of America account via Zelle. Now that they scream in, she connected to a TD Ameritrade Account – which she had not recently connected to it seemed as she had to contact them to be able to connect and offer transaction amounts to prove that it was her account and get access. She connected and setup a wire to get move the payments to an investment account. Additionally, a brand-new Cadillac Escalade showed up, a couple days after I originally contacted the FBI on Linked In. She said it was her car and that it was wrecked 2 months earlier. She showed a picture of the accident. It was only a single photo of a car that she supposedly hit. She did not have any photos of her car was suspicious and in addition, she was driving her son's car for an

exceedingly unusually long period for a car to be at a body shop and, it seemed strange that, as far as I know, when that work is performed, a loaner car is given. Either way, it is suspicious that she drives a \$180,000.00 car. She introduced me to her son at my request as he double majors in Economics and Math. Immediately upon connecting with him on WeChat his immediate comment was “Yeah, I am double majoring, thanks and bye”. He then messaged his Mom while we were still sitting together and told her that she is being a bad person to be using a man for money again. And that this is something she should not be doing. It seemed clear also that she lives on his allowance from a wealthy father with a minimum of available cash to spend. It is not feasible for her to own a car this expensive. It only recently showed up, after I wrote publicly that Chinese Clandestine activities are happening to Seattle ASI companies and that it needs to stop and I tagged the director of the Seattle Bureau Office in the post. If it is hers and is non-associated to this, the ability to financially take advantage of men such that it produces the ability to own a vehicle of this cost, is equally concerning.

Bottom line: Her financial activities, especially recently, and considering that it is involving strangers that have no other contact information for her other than her WeChat feel the need to send her multiple thousands of dollars many times a day and that through this same source of acquisition of funds produced an ability to loan on or purchase such a car is at best, a highly active and lucrative money laundering operation or, payments for – I do not know what but, the amounts, if it has anything to do with what seems likely, payment by a foreign government for her actively working in her nations industry of Seattle Area High-Tech Worker subversion in the Dating-App Vertical industry they operate, I do not want to be participatory, even as a casual dating contact. Furthermore, my business and financial affinity, to see it as sport – I give her taxation and CPA selection advice as I found out that she was just charged with Tax-Evasion by the Canadian government. I feel fairly certain that these, singly individual but, in aggregate, possibly extremely large payments will also go unreported (if a Capone style immediate action charge is desirable).

Individuals Listed (Contact Information, etc)

Wilson (Huahao) Shang

Amy (Xiang) Li
